Eisenhower Matrix: LiftLog

The Do quadrant is the MVP (v1.0). Schedule items are planned for v2.0+.

	Urgent	Not Urgent
Important	**Do - (Your MVP)** • `log` command records date, exercise, weight, reps • Save to and load from `data/lifts.csv` • `history <exercise>` lists past sets, newest first • `prs` shows best estimated 1RM per exercise (Epley formula) • `stats` shows total volume per exercise for the current week • Input validation with clear error messages and a `help` command	**Schedule - (For V2.0+)** • Progressive-overload suggestion for next session's weight • Plate calculator (plates per side for a target weight) • ASCII chart of estimated 1RM over time • Workout templates (e.g., 5/3/1 cycles) • Bodyweight tracking and relative-strength ratios • `undo` / `edit` for mistyped sets • Weekly volume per muscle group via the free wger exercise API (no key), cached in `data/exercises.json`
Not Important	**Delegate - (Use a library)** • Date math and ISO-week bucketing: `java.time` (`LocalDate`, `IsoFields`) • Unit testing: JUnit 5 • Build, dependencies, runnable jar: Maven • Aligned table output: `String.format` / `java.util.Formatter`	**Delete - (Cut it)** • GUI or web front end • Cloud sync and user accounts • Apple Health / Strava API integration • AI-generated workout programs • Social sharing and leaderboards
